Exploratory and Predictive Models for Neuroimaging Data

- Functional Magnetic Resonance Imaging (fMRI) measures blood flow correlated with neuronal activity
- Main technique for non-invasive measurements of human brain structure and function.

With millions of simultaneous measurements from relatively few (10's to 1000's) participants, how do we learn interpretable models that can generalize from limited samples?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

With millions of simultaneous measurements from relatively few (10's to 1000's) participants, how do we learn interpretable models that can generalize from limited samples?

Towards a solution

Structured Probabilistic Machine Learning

With millions of simultaneous measurements from relatively few (10's to 1000's) participants, how do we learn interpretable models that can generalize from limited samples?

#### Towards a solution

#### Structured Probabilistic Machine Learning

Incorporate domain knowledge to enable learning from limited samples.

イロト 不得 トイヨト イヨト ヨー ろくぐ

With millions of simultaneous measurements from relatively few (10's to 1000's) participants, how do we learn interpretable models that can generalize from limited samples?

うして ふぼう ふほう ふほう しょう

#### Towards a solution

Structured Probabilistic Machine Learning

Capture uncertainty in model parameters

#### Probabilistic Models Bayesian Models

p(x|w) likelihood: model for brain images given model parameters

イロト イポト イヨト イヨト ヨー のくぐ

- p(w) prior: incorporating expert knowledge
- p(w|x) posterior: estimated model parameters

## Structure in Large Scale Neuroimaging Data

 hypothesis: fMRI signal is spatially smooth, due to anatomy, preprocessing ...

イロト 不得 トイヨト イヨト ヨー ろくで

• "soft" constraints e.g. *shrinkage, smoothness* easily incorporated using priors

# Structure in Large Scale Neuroimaging Data - II

 hypothesis: mental processes are spatially localized (Cohen and Bookheimer, 1994)

イロト 不得下 イヨト イヨト ヨー ろくで

• "hard" constraints i.e. structure are much more challenging

# Structure in Large Scale Neuroimaging Data - II

 hypothesis: mental processes are spatially localized (Cohen and Bookheimer, 1994)

うして ふぼう ふほう ふほう しょう

- "hard" constraints i.e. structure are much more challenging
- Construct models that jointly incorporate *spatial sparsity* and *spatially smoothness*

Key Idea: Information projection of the model p(x,w) to the structured set  ${\mathcal S}$ 

 $q^* = \mathop{\mathrm{arg\,min}}_{q \in \mathcal{S}} \mathrm{KL}(q \| p(x,w))$ 

Koyejo and Ghosh (2013); Koyejo et al. (2014)

◆□▶ ◆圖▶ ◆臣▶ ◆臣▶ ―臣 …のへぐ

Key Idea: Information projection of the model p(x,w) to the structured set  ${\mathcal S}$ 

 general purpose, easily applied to new structured sets

 $q^* = \mathop{\mathrm{arg\,min}}_{q \in \mathcal{S}} \mathrm{KL}(q \| p(x,w))$ 

Koyejo and Ghosh (2013); Koyejo et al. (2014)

イロト 不得 トイヨト イヨト ヨー ろくぐ

Key Idea: Information projection of the model p(x,w) to the structured set  ${\mathcal S}$ 

- general purpose, easily applied to new structured sets
- state of the art performance in many cases

イロト 不得 トイヨト イヨト ヨー ろくぐ

 $q^* = \mathop{\mathrm{arg\,min}}_{q \in \mathcal{S}} \mathrm{KL}(q \| p(x,w))$ 

Koyejo and Ghosh (2013); Koyejo et al. (2014)

Key Idea: Information projection of the model p(x,w) to the structured set  ${\mathcal S}$ 

 $q^* = \mathop{\mathrm{arg\,min}}_{q \in \mathcal{S}} \mathrm{KL}(q \| p(x,w))$ 

- general purpose, easily applied to new structured sets
- state of the art performance in many cases
- often significantly more scalable than equiv. conventional model
- particularly effective in several cases where sampling inference fails

・ロト ・ 日 ・ モ ト ・ 田 ・ うへぐ

Koyejo and Ghosh (2013); Koyejo et al. (2014)

# Human Connectome Project Data (Essen et al., 2013)

- Investigating association between human brain function and human behavior
- Joint exploratory analysis of task brain images and behavioral variables
- n = 497 adult subjects. Each subject has  $d_1 = 380$  behavioral variables,  $d_2 = 27000$  voxels

イロト 不得 トイヨト イヨト ヨー ろくで

# 2 Back vs 0 Back contrast (measures working memory)

Neural support is seen in a number of frontal and parietal regions and cerebellum, consistent with cognitive control systems usually engaged by the task. Behavioral correlates including both reaction time and accuracy on the task, showing greater neural engagement associated with slower and less accurate performance.

(Khanna, Ghosh, Poldrack, and Koyejo, 2016)

イロト 不得 とうき とうとう ほう

# REL vs MATCH contrast (measures relational processing)

Relational\_Acc -0.059 Relational\_Rel\_Acc -0.053 ReadEng\_AgeAd; -0.049 ReadEng\_Unadj -0.048 WM\_Acc -0.046 Relational\_Match\_Acc -0.045 PicVocab\_AgeAdj -0.044 PicVocab\_Unadj -0.043 WM\_2bk\_Acc -0.041

イロト 不得 トイヨ トイヨ ト うらつ

Neural support is observed in frontal, parietal, and occipital cortex. Behavioral correlates captured both performance on this particular task, as well as independent measures related to higher cognitive functions including working memory capacity, vocabulary, and reading.

(Khanna, Ghosh, Poldrack, and Koyejo, 2016)

• Effective exploratory and predictive modeling of biological data requires incorporating domain knowledge.

▲□▶ ▲圖▶ ▲臣▶ ★臣▶ = 臣 = の��

# Summary

• Effective exploratory and predictive modeling of biological data requires incorporating domain knowledge.

・ロト ・ 日 ・ モート ・ 田 ・ うへぐ

• Proposed structured probabilistic models via information projection as a promising framework.

# Summary

- Effective exploratory and predictive modeling of biological data requires incorporating domain knowledge.
- Proposed structured probabilistic models via information projection as a promising framework.

#### Neuroimaging Data Analysis:

- Incorporate the domain knowledge of structured spatial sparsity.
- State of the art performance in exploratory and predictive analysis of neuroimaging data

#### Collaborators

- Russell A. Poldrack (Stanford)
- Joydeep Ghosh (UT Austin)
- Rajiv Khanna (UT Austin)
- Michael Riis Andersen (TU Berlin)

# Backup Slides

Simulated Data Results: Support Recovery k=20, d=10,000, SNR = 20 dB,  $n = 100, \dots, 400$ 

# FMRI stop signal task (White et al., 2014)

• stop signal task: designed to measure impulse control

 $z = 2 \qquad \qquad z = 5 \qquad \qquad z = 12$ 

• 
$$n = 126, d = 10,000, k^* = 300$$

 recovered regions correlated with stop signal reaction time e.g. include orbitofrontal cortex, dorsolateral prefrontal cortex, putamen, anterior cingulate, parietal cortex

(Koyejo et al., 2014)

#### Time varying brain networks from HCP

### Time varying brain networks from HCP
