

Real-time bright transient identification with ML for ZTF

The Transient and Variable Universe

21st June 2023

Nabeel Rehemtulla, Adam Miller on behalf of ZTF
Northwestern University, CIERA

Northwestern

Zwicky Transient Facility (ZTF)

- Wide-field time-domain survey in g- and r-band
- 10^6 alert packets / night

<https://www.ztf.caltech.edu/>

The Bright Transient Survey (BTS)

Spectroscopically classify **all** extragalactic transients from ZTF with $m_{\text{peak}} < 18.5$ mag

2018 → Present

- >7,000 SNe publicly classified
- Near-perfect completeness
- Best SN population estimations

Animation credit: Christoffer Fremling

Fremling+20, Perley+20

How does BTS work?

**10^6 alerts / night
from ZTF**

**Classified bright
transients**

How does BTS work?

Static filters remove:

- Bogus alerts
- Asteroids
- Some variables
- Alerts >19 mag

Candidate BTS sources include **bright and dim transients, AGN, CVs, variable stars**

How does BTS work?

Static filters remove:

- Bogus alerts
- Asteroids
- Some variables
- Alerts >19 mag

Candidate BTS sources include **bright and dim transients, AGN, CVs, variable stars**

“Scanning”: Humans manually inspect BTS candidates and bookmark (“save”) bright transients

Data available to scanners

Cutouts

(science, reference, difference)

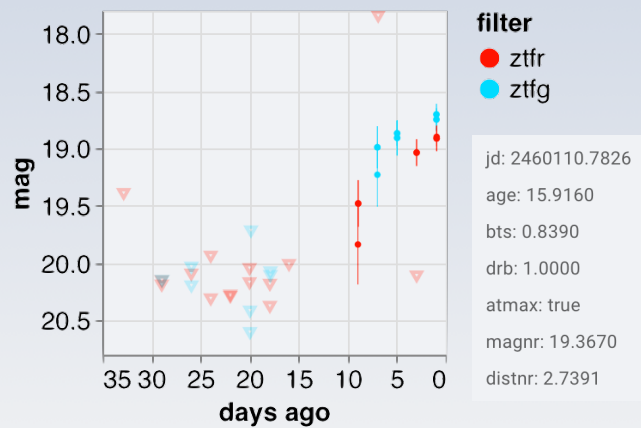

Light curve

Miscellaneous features

(RA, Dec., other survey images)

Data available to scanners

1/50

2/50

50x / night!

Problems with scanning

Time

- Tedious & requires expertise
- Human delay
- Not scaleable to deeper surveys (e.g., Rubin)

How does BTS work?

Static filters remove:

- Bogus alerts
- Asteroids
- Some variables
- Alerts >19 mag

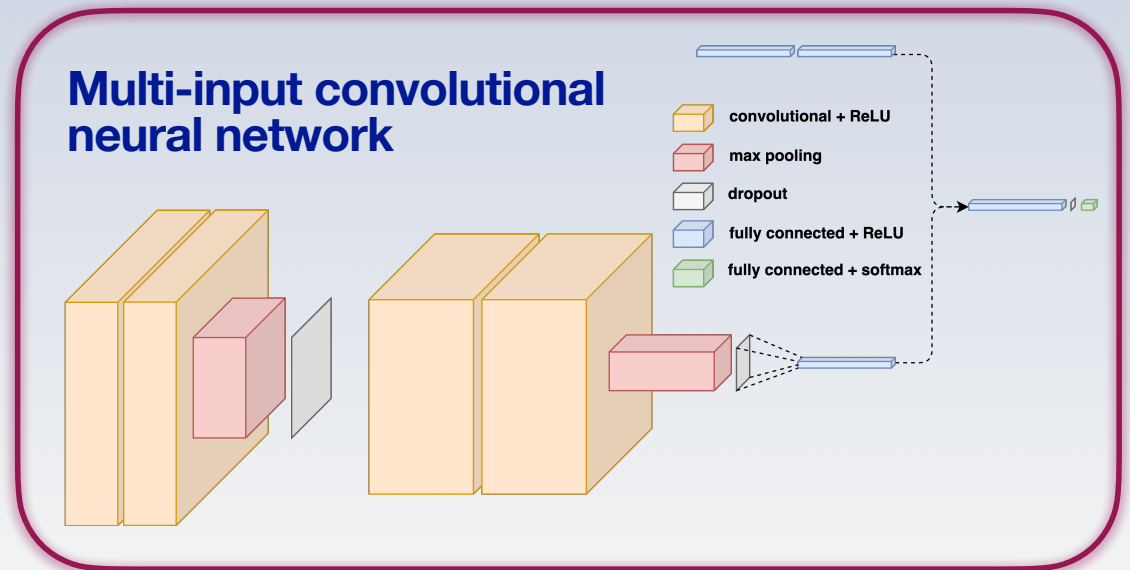

Candidate BTS sources include **bright and dim transients, AGN, CVs**

No time-series information!

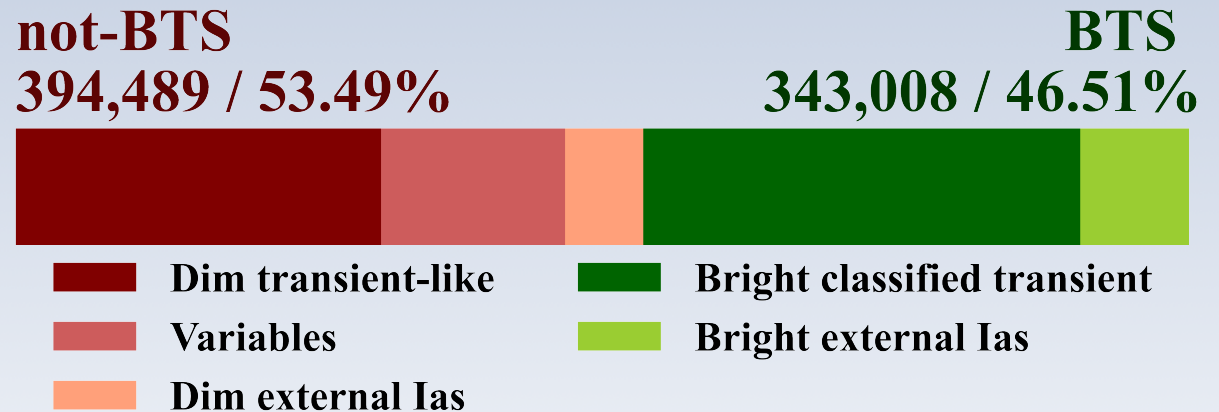

Training the model

Training set

Enabled by ZTF archive

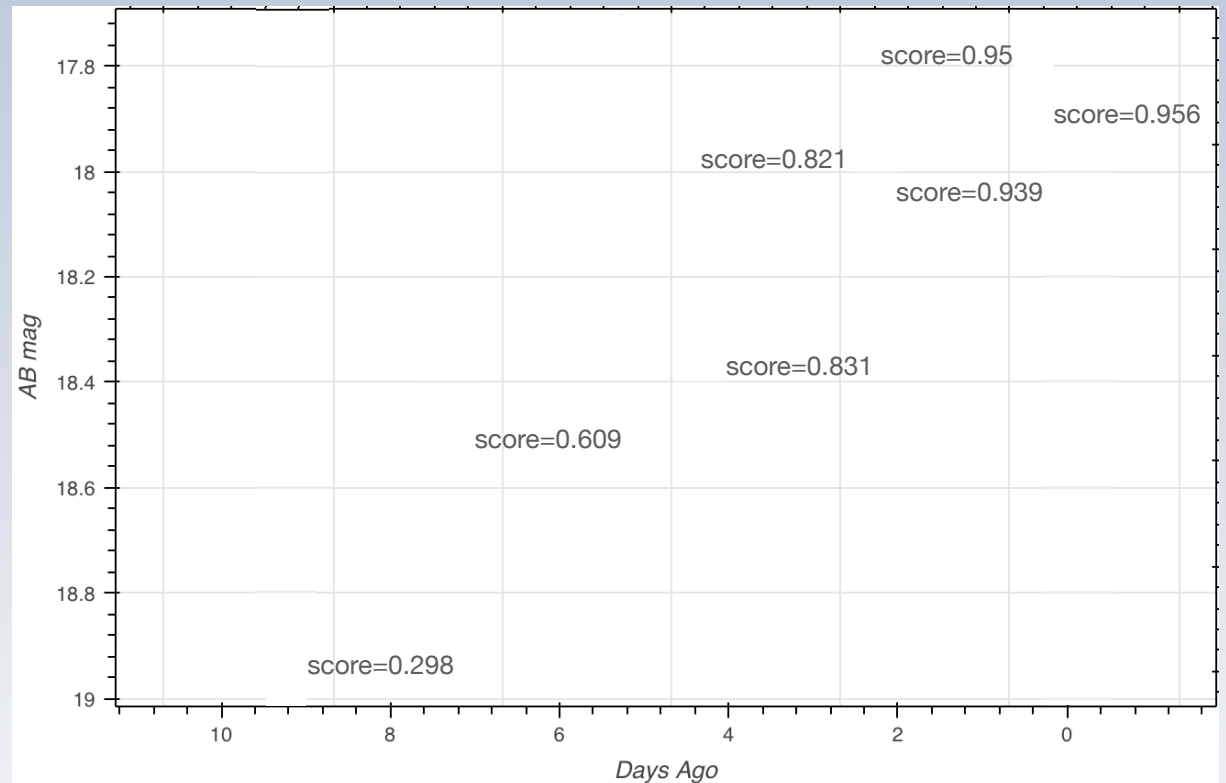

Prevent overfitting

- Class weights
- Thinning alerts
- Data augmentation

Alert-to-source classification policy

- Many scores per source
- When to call a **source** a bright transient?
- Define *policy*

Completeness and purity

gtN: Classify as bright transient
when $\geq N$ alerts with score ≥ 0.5

$$\text{Completeness} = \frac{\text{TP}}{\text{TP} + \text{FN}}$$

$$\text{Purity} = \frac{\text{TP}}{\text{TP} + \text{FP}}$$

Save-time analysis

gtN: Classify as bright transient
when $\geq N$ alerts with score ≥ 0.5

Operating in real-time

- Running in real-time on all new ZTF alerts

autoscan

- Check for new bright transients during the night
- Save sources that pass chosen policy
- *Next:* Automatically request a spectrum during the night

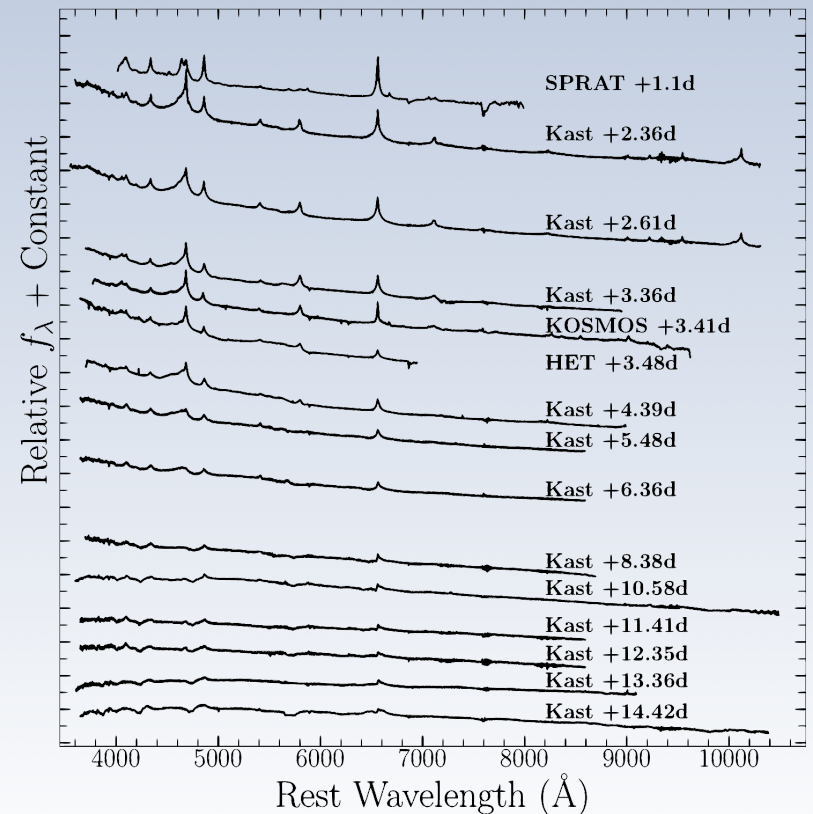

Same-night follow-up

Case study: SN2023ixf, a SN in M101

- Discovered by Koichi Itagaki - 05/19 14:42 PDT
- First spectrum (Perley+2023) - 05/19 15:23 PDT
- Detection by ZTF - 05/19 00:45 PDT
 - Score=0.840 from **BTSbot**

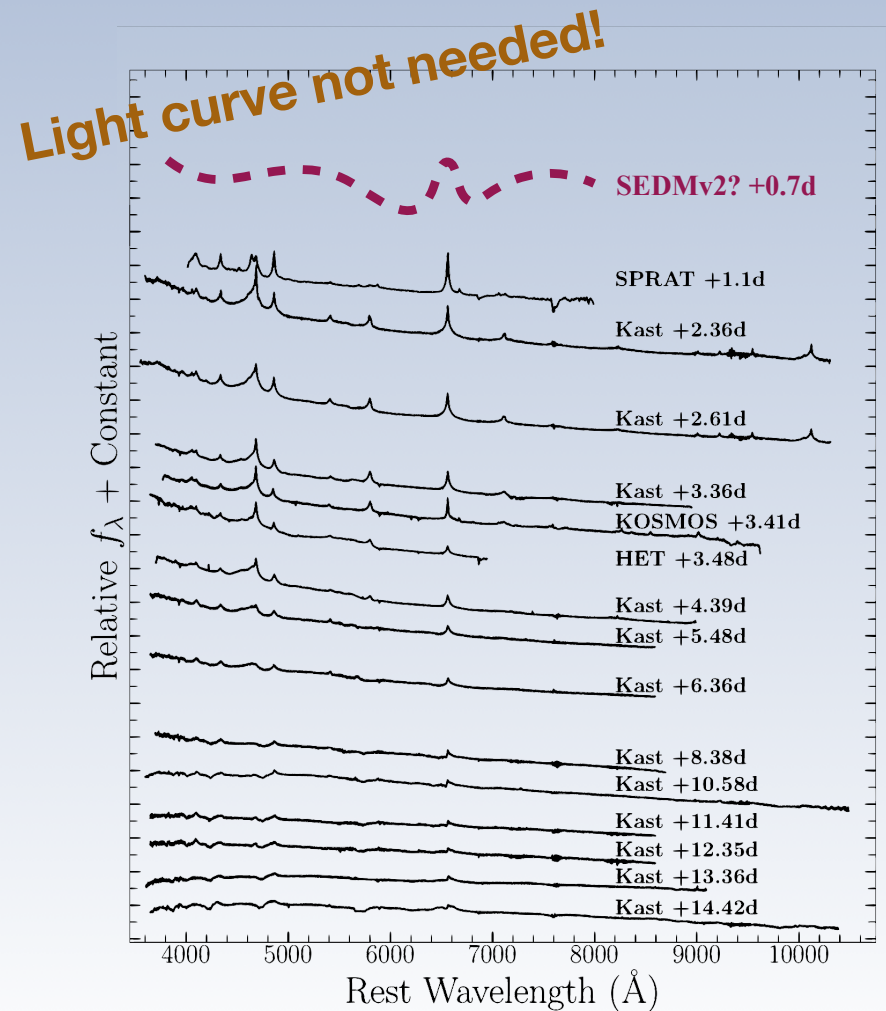

- **autoscan** sees new alert by - 05/19 01:00 PDT
 - Identify source and request spectrum
- End of observing - 5/20 05:00 PDT

Case study: SN2023ixf, a SN in M101

- Discovered by Koichi Itagaki - 05/19 14:42 PDT
 - First spectrum (Perley+2023) - 05/19 15:23 PDT
 - Detection by ZTF - 05/19 00:45 PDT
 - Score=0.840 from **BTSbot**
-
- **autoscan** sees new alert by - 05/19 01:00 PDT
 - Identify source and request spectrum
 - End of observing - 5/20 05:00 PDT

Conclusions

- Automating scanning for BTS
- **BTSbot**: MI-CNN, no light-curves
- Outperforms expert scanners
 - 99% complete, 0.3 d quicker
- Integrated into ZTF
- **autoscan**: accelerating follow-up

Thank you!

Ask me about:

- Techniques to mitigate overfitting
- Model performance without metadata
- Application to LSST, LS4, etc.

Bonus slides

Performance metric definitions

Completeness, purity, and save-time analysis

$$\text{Completeness} = \frac{\text{TP}}{\text{TP} + \text{FN}}$$

jd_{BTSbot} jd of first alert to pass policy

jd_{scanner} jd of save to BTS group on Fritz
(alert broker)

$$\text{Purity} = \frac{\text{TP}}{\text{TP} + \text{FP}}$$

$$\Delta jd = jd_{\text{scanner}} - jd_{\text{BTSbot}}$$

Selected metadata features

- `sgscore{1,2}` - Star-galaxy score of nearest two sources PS1-catalog
- `distpsnr{1,2}` - angular distance to nearest two sources PS1-catalog
- `fwhm` - Full Width Half Max
- `magpsf` - PSF magnitude
- `sigmapsf` - 1-sigma uncertainty in PSF magnitude
- `ra, dec` - Right Ascension and Declination

Selected metadata features

- `diffmaglim` - Limiting magnitude for detection in difference image
- `ndethist` - Number of ZTF detections at this location
- `nmtchps` - Number of PS1 source matches within 30"

Custom features:

- `age` - Days since first detection
- `peakmag` - Brightest PSF magnitude so far

Even quicker, deeper saves

Trigger on sources with $m < 19$ mag

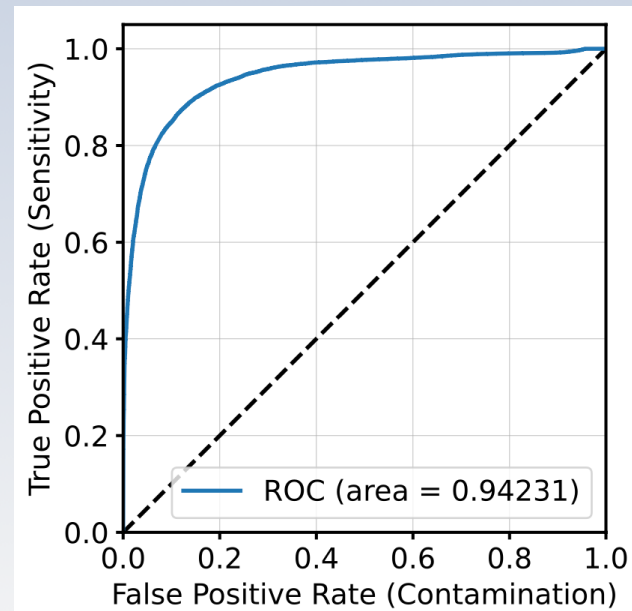

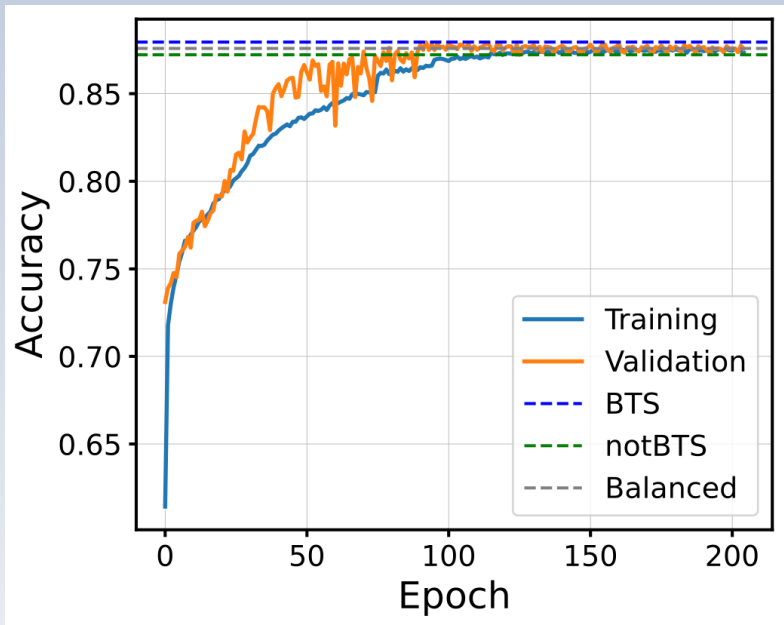

Even quicker, deeper saves

gt1 is as fast as possible for many sources

Other performance metrics
